

ABSTRACT

5 A three-dimensional maze game in the form of a hand-held toy. The hand held toy is in
the form of a cube. The toy comprises a substantially cubic non-transparent body
containing a plurality of intersecting pathways for an object and an entrance aperture
and single/multiple exit apertures connecting the pathways wherein each intersection
formed by the intersecting pathways is provided with means to bring the object to rest
10 till the toy is tilted and the object follows a vertical pathway that is defined by the tilting
of the toy. The object is inserted into an entry point in the toy and the player has to
bring the object out through an exit point by following a fixed number of steps in
turning the toy. The challenge is to find the correct sequence of turns and considerable
amount of mental dexterity is required for the purpose.
